

Reflective Portfolio Summary

Project Interface and Code

- Working with the code that Alex and others had implemented, I made changes to many of the PHP files in htdocs and php.ini plus other configuration files to make the program useable on my computer plus others. Likewise I made changes to the profile page, including implementation of a graph to give a visual representation of how much storage is being used by the User.

Selenium Unit Testing

- Using Selenium WebDriver and the Safari extension, unit tests were created to ensure no issues with logging in/out and uploading/viewing/deleting of files as changes were made to the application.

Sprint Plan

- My role as part of the sprint plan was to help identify the key parts of the plan and how they would best be broken down and the time that should be roughly allocated for the completion of each task.

Surveys

- As part of developing the media vault, it was important to gain feedback about the design of the website and what users thought could be improved. As a result I created a survey and asked people to complete it after using a version of the media vault.

Survey Summary

- After retrieving the completed surveys, my responsibility was to summarise the information gathered from the surveys and utilise this information as feedback for further improvements of the design.

User Stories

- As part of developing the user stories, part of my responsibility was developing acceptance criteria for each User story to ensure we were meeting the requirements of the clients.
